

Agentic Engineering Workshop for your team.

A full day at your office. Your engineers direct Claude Code from the first plan to working, reviewed code, with instructors beside them who ship production code with agents every day. They leave with techniques they use the next morning.

- **Format:** private workshop for one team, hands-on from the first hour
- **Length:** one full day, about 09:30 to 17:30
- **Size:** up to 20 engineers
- **Where:** on-site at your office
- **Price:** from EUR 4,000 per day for up to ten engineers
- **Booking:** a 20-minute call to scope the day, then a written proposal

What your team leaves knowing

- **Context engineering:** the rules files and skills the agent follows
- **Consistent output:** driving agents to it, and splitting work to fit the context window
- **Review that keeps up:** test loops and review workflows for AI-speed pull requests
- **Agent-driven git:** branches and worktrees for parallel agent work
- **Judgment:** what to delegate to an agent, and what to do yourself

What you can check on afterwards

The day is built for two things you can measure: agent usage goes up, and your engineers run multi-hour agent sessions instead of pasting snippets. At the wrap-up, every engineer names one feedback loop they will set up on Monday, and you are welcome in the room for it.

"What convinced me was having engineers who've gone deep in the tech and teach tool-agnostic fundamentals you can carry into day-to-day work. My team came back building in an AI-friendly way, and we used it to migrate hundreds of repos at scale."

Alex Kliotzkin, Director of Engineering, Infineon

HELPING ENGINEERS FROM TEAMS AT

Quick answers

Security and data. We bring the project, so none of your code, data, or credentials goes into an agent. Neither of our on-site days so far needed an NDA. Your engineers use their own Claude accounts, under your terms with Anthropic.

Tools. Claude Code in the terminal. Each engineer needs a Claude subscription with headroom for a full day of agent work, which uses far more than a normal day. GitLab teams work in a throwaway GitHub sandbox for the day. Windows runs through WSL. Copilot and Cursor users are welcome, as the techniques carry over.

Level. Comfort reading and writing code. No agent experience is needed. We hold two or three 15-minute calls with participants beforehand, or a short survey, to set the level of the day.

Our own codebase? We teach on a project we bring, so everyone starts from the same place. Your engineers apply the techniques in your codebase the next day.

Who should be in the room? Engineers who write code most days and already use Claude Code, Copilot, or something similar. Mixed levels work, and the calls beforehand tell us how wide the spread is.

What do we need to provide? A date, a room with a projector and power at every seat, the participant list two weeks before the day, and lunch.

Remote? On-site only for now.

How long from call to workshop? About four weeks: the call, a proposal, a date, then setup instructions to the participants one week before the day.
